DETAILED ACTION

New Art Unit

1. Please include the new Art Unit 2621 in the caption or heading of any written or facsimile communication submitted after this Office Action because the examiner, who was assigned to Art Unit 2616, will be assigned to new Art Unit 2621. Your cooperation in this matter will assist in the timely processing of the submission and is appreciated by the Office.

Response to Arguments

2. Applicant's arguments with respect to claims 1-4 and 6 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

4. Claims 1-4 and 6 are rejected under 35 U.S.C. 102(e) as being anticipated by Itoh et al (6,700,989).

Regarding claims 1 and 4, Itoh et al disclose a method and means of detecting a watermark in a compressed video signal comprising spectral coefficients obtained by

transforming pictures of said video signal (Col 29, lines 55-56 "compressed data are expanded by an MPEG decoder 56"), consisting essentially of:

- accumulating spatially corresponding coefficients of a plurality of pictures (Col 29, lines 55-56 "compressed data are expanded by an MPEG decoder 56");
- inverse transforming said accumulated coefficients into an accumulated plurality of pictures (Col 29, lines 55-56 "compressed data are expanded by an MPEG decoder 56"); and
- detecting the watermark in said accumulated plurality of pictures (Col 3, lines 20-23 "a scheme wherein the electronic watermark is superposed on and inserted into sampled value regions of two dimensions or three dimensions" and Col 4, lines 44-46 "The digital detection of the DHS watermark is easy in various areas [moving image data, compressed data, transmission data, sector data, etc.]").

Regarding claims 2 and 3, Itoh et al disclose a method of detecting a watermark wherein the encoded video signal includes predictively encoded pictures including motion vectors and wherein the step of accumulating coefficients is applied to the coefficients representing the residual pictures irrespective of coefficients representing the prediction picture and irrespective of said motion vectors (Col 29, lines 55-56 "compressed data are expanded by an MPEG decoder 56").

Regarding claim 6, Itoh et al disclose a device for recording and/or playing back a compressed video signal comprising means for disabling recording and/or playback of the video signal in dependence upon the presence of a watermark in the video signal

Art Unit: 2621

(Col 4, lines 42-43 "The copy restriction mode is easily detected by a video recording/reproduction device" and Col 29, lines 56-58 "the display 59 of the watermarked moving image [53] is presented by a display device 57 in the case where the reproduction is permitted") detected as described above.
